Learn how nuclear fission works The new Student Science app for iPad is designed to help students at all levels grasp the basics of science, biology, and more. This app is part of The Teaching Channel's science program, which provides step-by-step methods, resources, and apps for K-12 science teachers. Nuclear Fission is a Java-based simulation designed to help teachers explain the basics of nuclear fission to their students. It includes three very accessible simulations. Understand why nuclear fission occurs Uranium 235 was used in early nuclear bombs, and still sees some use today, and it is one of the two main fuels for nuclear reactors. It is an unstable isotope, and it can sustain a chain reaction when a nucleus is hit with a neutron. The first experiment is quite simple, requiring you to fire a neutron at a Uranium 235 nucleus. It will split into smaller nuclei and release neutrons that can continue the chain reaction. Set up a nuclear chain reaction When a Uranium 235 nucleus undergoes fission, it released additional neutrons that can strike other nearby nuclei and continue the reaction. The second experiment allows you to observe such a chain reaction. You can customize the proportion of Uranium 235 and Uranium 238 nuclei. Since the latter is a stable isotope, it can either slow down the reaction or halt it altogether. Experiment with a nuclear reactor Nuclear fission is also used for power generation, and you can see how a reactor is set up in the final simulation. Using the control rods, you can manage the speed of the chain reaction or even stop it completely in order to control the power output and energy production. In short, Nuclear Fission is an interesting program that can help teachers explain the basics of nuclear fission to their students. It is very accessible and easy to use. Explain Nuclear Physics is a Java-based application designed to help teachers explain nuclear physics. It simulates nuclear fusion and fission, and also helps to understand how nuclear reactions can be used to create energy. Why should you use this application? Have you ever heard of nuclear fusion? Many people think it is a theory, or that it is a kind of science fiction, however it is a fact. There are many experiments that prove that a nuclear fusion reactor can actually be built, and there are currently two operational fusion reactors. By using Explain Nuclear Physics you can provide

Fusion (In this video and in other videos of this series) is simply the process in which atoms are joined together to form a single larger atom. Any atom that has enough mass is potentially fusible, while any atom that has too little mass is not, forming the basis of what we understand as the periodic table. Such a joining of atoms, if it were to occur at the conditions

of the interior of the sun, the center of the Earth, or within the core of a star, would produce a hot plasma of extremely
