Space Bound is a futuristic, sci-fi, Strategy Shooter game. In the year of 2353, the earth has become a toxic wasteland that can only be grown by using Resources to flourish into a New Earth. The world is practically dead. With the attempt to turn on the sun, the world has started to freeze over. In this poor state, the humans have finally gone extinct. But with the remaining few human survivors, the Game is a battle to keep the world alive. The story of Space Bound revolves around the Amelie, a character who is an orphan from the planet Jorek. Her race, the Kesh, are the only survivors of the dying planet and are a warrior race that can control Amelie. On the planet of Jorek, Amelie and her few remaining companions had been living in the man's basements. The planet is slowly dying, the only chance for survival is to reach the sun. Amelie has gone through the final stage of the transformation and is now flying towards the sun. But the development of the planet of Jorek is at a dead end. The closest access point is known as the Terrashore and it has been discovered that the planet is already stuck on the star, no matter how hard the planet tries, it is futile. But that is not the only problem. On the Terrashore, there is the Spacebound Station. The Spacebound Station is also a major player in this final war. The player is forced to fight a giant robot called the Wyrd and the station's AI and crew are also all a major threat. The AI controls the station as well as the robots; if they detect that the Amelie is going to be heading to the sun, they will attempt to stop Amelie using their production line. Their production line is capable of producing some horrible weapons that will do a lot of damage to the Amelie. The crew, who can all be promoted to soldier or assistant, will attempt to bring Amelie back, but will be reckless if they fire their weapons. They are also forced to work against their own kind, humans. Along with the AI and the crew, there is another threat: The robot. The robots are capable of being made in three stages, the primitive ones require brute force, the advanced robots are much more intelligent. The advanced robots are capable of small craft, like the Wrt, which are like land based robots, and the massive W.G.B.

What's new:

ary Stabilization (SBS) devices are known in the art of seismic exploration. One common example of an SBS device is a “shaker” unit. Shaker units are typically placed on the ocean floor to evaluate possible hydrocarbon-bearing zones. Shakers are impacted by vibratory energy such as water impingement and are configured to detect the decompression phase of the sonic impact (i.e., the rebound). Ranging from two (2) meters, to over twenty-five (25) meters in length, shakers are configured to produce blast pressures on the order of twenty-two (22) point two (22.2) kPa to forty-five (45) point two (45.2) kPa at up to nine hundred sixty (960) hertz (0.96 kHz). In common use, shakers are driven by a land-based source of vibratory energy. Also in common use are Global Positioning System (GPS) seismometers, which emit a

continuous signal that is generated by a source such as an air gun or explosive charge. Typically, the source is located on or near the top of a seismic energy source array. The seismic source array can be towed over the targeted area, similar to the procedure used with shakers. The seismic energy source array is configured for continuous or intermittent discharge of energy to generate a seismic signal over a specific area to be measured. Afterward, seismic sensors, such as, but not limited to, land-based source receivers, are typically spread out for detection. Therefore, a single seismic receiver generally cannot detect the same signal from several shakers and a GPS receiver cannot determine the absolute location of the source. The two common types of vibration sources (explosive or pneumatic/hydraulic) have been used with conventional land-based seismic receivers. The seismic sources are typically towed behind boats or moved by other mobile units such as trucks and backhoes. However, shakers that come on the top of the source (top-mounted shakers or TMS) can be used in almost any location. The source and receivers are connected by cables that contain communication and power conductors. Many methods have been used for source and seismic receiver connection, which, in turn, connect receiver signals to equipment located in vessels and other mobile platforms for demodulation, recording, and transmission of information. One common method of connecting seismic cables or source cables to receivers is through a “U” or
