Mushkil bahaara english. 133733436Relative growth of nasal turbinates in guinea pigs. To evaluate nasal turbinate growth rates during an 8-week period, six groups of female Hartley guinea pigs, 3.5 months of age, were weighed and surgically prepared. The animals were then observed for 8 weeks, after which they were euthanized and their nasal turbinates removed. An index, based on the ratio of turbinate weight to body weight, was constructed to express the relative weight of each turbinate. Our index indicated that, in the control group, the right nasal turbinate grew more quickly than the left. This result indicates that the right nasal turbinate was in a more advanced stage of growth than the left and that, as a result, the right turbinate was heavier than the left. In addition, 3 of the 6 experimental groups demonstrated a doubling of the left turbinate index. On the basis of our study design, we conclude that Hartley guinea pigs have a high rate of submucosal growth in the left nasal turbinate.1. Field of the Invention The present invention relates to a method and an apparatus for information processing, and more particularly to a method and an apparatus for managing and handling information in an information processing system having a plurality of information handlers. 2. Description of the Related Art Conventional techniques of managing and handling the information in the information processing system which have a plurality of information handlers are disclosed in Japanese Patent Publication Kokai No. 57-92735, U.S. Pat. No. 4,680,587, and U.S. patent application Ser. No. 07/151,534, now U.S. Pat. No. 5,300,915 and assigned to the same assignee of the present application. The conventional techniques are arranged such that each information handler generates its own log record on the information processing system when an event to be logged is detected
